EXPERIMENT 10

Creating Multiple IAM Users in Terraform

Objective:

Learn how to use Terraform to create multiple IAM users with unique settings.

Prerequisites:

- Terraform installed on your machine.
- AWS CLI configured with the necessary credentials.

Steps:

1. Create a Terraform Directory:

```
mkdir terraform-iam-users
cd terraform-iam-users
```

```
C:\Users\aksha>mkdir terraform-iam-users
C:\Users\aksha>cd terraform-iam-users
C:\Users\aksha\terraform-iam-users>|
```

- Create Terraform Configuration Files:
- Create a file named main.tf:

iam.tf

```
variable "iam_users" {
  type    = list(string)
  default = ["user1", "user2", "user3"]
}

resource "aws_iam_user" "iam_users" {
  count = length(var.iam_users)
  name  = var.iam_users[count.index]

  tags = {
```

```
Name = "${var.iam_users[count.index]}"
}
}
```

A screenshot of a code editor with two tabs: 'iam.tf' and 'provider.tf'. The 'iam.tf' tab is active, showing a Terraform configuration. It defines a variable 'iam_users' as a list of strings with a default value of ['user1', 'user2', 'user3']. Then, it defines a resource 'aws_iam_user' named 'iam_users' in a loop. The resource's 'count' is set to the length of 'iam_users', and its 'name' is set to 'iam_users[count.index]'. The 'tags' block contains a 'Name' tag with the value '\${var.iam_users[count.index]}'.

```
iam.tf > resource "aws_iam_user" "iam_users"
1  variable "iam_users" {
2      type      = list(string)
3      default = ["user1", "user2", "user3"]
4  }
5
6  resource "aws_iam_user" "iam_users" {
7      count = length(var.iam_users)
8      name = var.iam_users[count.index]
9
10     tags = {
11         Name = "${var.iam_users[count.index]}"
12     }
13 }
```

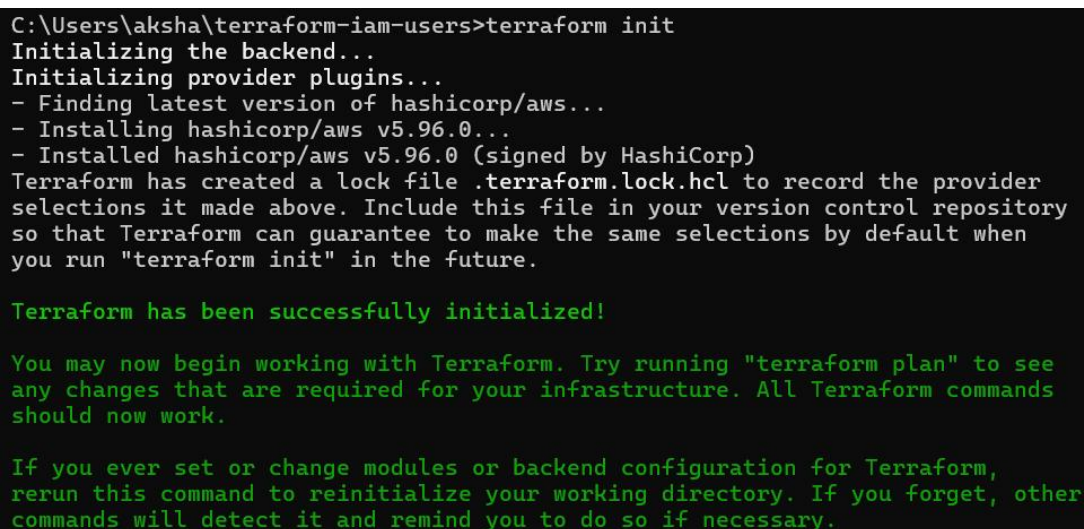

In this configuration, we define a list variable `iam_users` containing the names of the IAM users we want to create. The `aws_iam_user` resource is then used in a loop to create users based on the values in the list.

2. Initialize and Apply:

Run the following Terraform commands to initialize and apply the configuration:

terraform init

terraform apply

A screenshot of a terminal window showing the output of the 'terraform init' command. The output indicates that the backend is initialized, provider plugins are found and installed (hashicorp/aws v5.96.0), and a lock file '.terraform.lock.hcl' is created. It concludes with 'Terraform has been successfully initialized!' and provides instructions on how to proceed with 'terraform plan' and 'terraform apply'.

```
C:\Users\aksha\terraform-iam-users>terraform init
Initializing the backend...
Initializing provider plugins...
- Finding latest version of hashicorp/aws...
- Installing hashicorp/aws v5.96.0...
- Installed hashicorp/aws v5.96.0 (signed by HashiCorp)
Terraform has created a lock file .terraform.lock.hcl to record the provider
selections it made above. Include this file in your version control repository
so that Terraform can guarantee to make the same selections by default when
you run "terraform init" in the future.

Terraform has been successfully initialized!

You may now begin working with Terraform. Try running "terraform plan" to see
any changes that are required for your infrastructure. All Terraform commands
should now work.

If you ever set or change modules or backend configuration for Terraform,
rerun this command to reinitialize your working directory. If you forget, other
commands will detect it and remind you to do so if necessary.
```

```
C:\Users\aksha\terraform-iam-users>terraform apply
```

Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the following symbols:

+ create

Terraform will perform the following actions:

aws_iam_user.iam_users[0] will be created

```
+ resource "aws_iam_user" "iam_users" {
+   arn          = (known after apply)
+   force_destroy = false
+   id           = (known after apply)
+   name         = "user1"
+   path         = "/"
+   tags         = {
+     + "Name" = "user1"
+   }
+   tags_all     = {
+     + "Name" = "user1"
+   }
+   unique_id    = (known after apply)
+ }
```

aws_iam_user.iam_users[1] will be created

```
+ resource "aws_iam_user" "iam_users" {
+   arn          = (known after apply)
+   force_destroy = false
+   id           = (known after apply)
+   name         = "user2"
+   path         = "/"
+   tags         = {
+     + "Name" = "user2"
+   }
+   tags_all     = {
+     + "Name" = "user2"
+   }
+   unique_id    = (known after apply)
+ }
```

aws_iam_user.iam_users[2] will be created

```
+ resource "aws_iam_user" "iam_users" {
+   arn          = (known after apply)
+   force_destroy = false
```

```
+   id           = (known after apply)
+   name         = "user3"
+   path         = "/"
+   tags         = {
+     + "Name" = "user3"
+   }
+   tags_all     = {
+     + "Name" = "user3"
+   }
+   unique_id    = (known after apply)
+ }
```

Plan: 3 to add, 0 to change, 0 to destroy.

Do you want to perform these actions?

Terraform will perform the actions described above.

Only 'yes' will be accepted to approve.

Enter a value: yes

aws_iam_user.iam_users[2]: Creating...

aws_iam_user.iam_users[0]: Creating...

aws_iam_user.iam_users[1]: Creating...

aws_iam_user.iam_users[1]: Creation complete after 1s [id=user2]

aws_iam_user.iam_users[2]: Creation complete after 1s [id=user3]

aws_iam_user.iam_users[0]: Creation complete after 1s [id=user1]

Apply complete! Resources: 3 added, 0 changed, 0 destroyed.

```
C:\Users\aksha\terraform-iam-users>
```

Terraform will prompt you to confirm the creation of IAM users. Type yes and press Enter.

3. Verify Users in AWS Console:

- Log in to the AWS Management Console and navigate to the IAM service.
- Verify that the IAM users with the specified names and tags have been created.

Identity and Access Management (IAM)

Search IAM

Dashboard

▼ Access management

User groups

Users

Roles

Policies

Identity providers

Account settings

Root access management [New](#)

▼ Access reports

Users (4) Info

An IAM user is an identity with long-term credentials that is used to interact with AWS in an account.

Search

<input type="checkbox"/>	User name	Path	Group	Last activity	MFA	Password age	Console last sign-in	Acc
<input type="checkbox"/>	Akshat	/	0	Yesterday	-	4 days	-	Act
<input type="checkbox"/>	user1	/	0	-	-	-	-	-
<input type="checkbox"/>	user2	/	0	-	-	-	-	-
<input type="checkbox"/>	user3	/	0	-	-	-	-	-

Buttons: [Delete](#) [Create user](#)

4. Update IAM Users:

- If you want to add or remove IAM users, modify the `iam_users` list in the `main.tf` file.
- Rerun the terraform apply command to apply the changes:

terraform apply

```
C:\Users\aksha\terraform-iam-users>terraform apply

Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the
following symbols:
+ create

Terraform will perform the following actions:

# aws_iam_user.iam_users[0] will be created
+ resource "aws_iam_user" "iam_users" {
+   arn                = (known after apply)
+   force_destroy      = false
+   id                 = (known after apply)
+   name               = "user1"
+   path               = "/"
+   tags               = {
+     "Name" = "user1"
+   }
+   tags_all           = {
+     "Name" = "user1"
+   }
+   unique_id          = (known after apply)
}

# aws_iam_user.iam_users[1] will be created
+ resource "aws_iam_user" "iam_users" {
+   arn                = (known after apply)
+   force_destroy      = false
+   id                 = (known after apply)
+   name               = "user2"
+   path               = "/"
+   tags               = {
+     "Name" = "user2"
+   }
+   tags_all           = {
+     "Name" = "user2"
+   }
+   unique_id          = (known after apply)
}

# aws_iam_user.iam_users[2] will be created
+ resource "aws_iam_user" "iam_users" {
+   arn                = (known after apply)
+   force_destroy      = false
```

```
+   id                 = (known after apply)
+   name               = "user3"
+   path               = "/"
+   tags               = {
+     "Name" = "user3"
+   }
+   tags_all           = {
+     "Name" = "user3"
+   }
+   unique_id          = (known after apply)
}

Plan: 3 to add, 0 to change, 0 to destroy.

Do you want to perform these actions?
Terraform will perform the actions described above.
Only 'yes' will be accepted to approve.

Enter a value: yes

aws_iam_user.iam_users[2]: Creating...
aws_iam_user.iam_users[0]: Creating...
aws_iam_user.iam_users[1]: Creating...
aws_iam_user.iam_users[1]: Creation complete after 1s [id=user2]
aws_iam_user.iam_users[2]: Creation complete after 1s [id=user3]
aws_iam_user.iam_users[0]: Creation complete after 1s [id=user1]

Apply complete! Resources: 3 added, 0 changed, 0 destroyed.

C:\Users\aksha\terraform-iam-users>
```

5. Clean Up:

- After testing, you can clean up the IAM users:

terraform destroy

```
C:\Users\aksha\terraform-iam-users>terraform destroy
aws_iam_user.iam_users[1]: Refreshing state... [id=user2]
aws_iam_user.iam_users[0]: Refreshing state... [id=user1]
aws_iam_user.iam_users[2]: Refreshing state... [id=user3]

Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the following symbols:
- destroy

Terraform will perform the following actions:

# aws_iam_user.iam_users[0] will be destroyed
- resource "aws_iam_user" "iam_users" {
  - arn                = "arn:aws:iam::158878148841:user/user1" -> null
  - force_destroy      = false -> null
  - id                 = "user1" -> null
  - name               = "user1" -> null
  - path               = "/" -> null
  - tags               = {
    - "Name" = "user1"
  } -> null
  - tags_all           = {
    - "Name" = "user1"
  } -> null
  - unique_id          = "AIDASJ7PAFDU4IYNSMQKA" -> null
  # (1 unchanged attribute hidden)
}

# aws_iam_user.iam_users[1] will be destroyed
- resource "aws_iam_user" "iam_users" {
  - arn                = "arn:aws:iam::158878148841:user/user2" -> null
  - force_destroy      = false -> null
  - id                 = "user2" -> null
  - name               = "user2" -> null
  - path               = "/" -> null
  - tags               = {
    - "Name" = "user2"
  } -> null
  - tags_all           = {
    - "Name" = "user2"
  } -> null
  - unique_id          = "AIDASJ7PAFDU3CXXOTVHR" -> null
  # (1 unchanged attribute hidden)
}

# aws_iam_user.iam_users[2] will be destroyed
- resource "aws_iam_user" "iam_users" {
  - arn                = "arn:aws:iam::158878148841:user/user3" -> null
  - force_destroy      = false -> null
  - id                 = "user3" -> null
  - name               = "user3" -> null
  - path               = "/" -> null
  - tags               = {
    - "Name" = "user3"
  } -> null
  - tags_all           = {
    - "Name" = "user3"
  } -> null
  - unique_id          = "AIDASJ7PAFDUZLVVP3INN" -> null
  # (1 unchanged attribute hidden)
}

Plan: 0 to add, 0 to change, 3 to destroy.

Do you really want to destroy all resources?
Terraform will destroy all your managed infrastructure, as shown above.
There is no undo. Only 'yes' will be accepted to confirm.

Enter a value: yes

aws_iam_user.iam_users[0]: Destroying... [id=user1]
aws_iam_user.iam_users[2]: Destroying... [id=user3]
aws_iam_user.iam_users[1]: Destroying... [id=user2]
aws_iam_user.iam_users[2]: Destruction complete after 2s
aws_iam_user.iam_users[1]: Destruction complete after 2s
aws_iam_user.iam_users[0]: Destruction complete after 2s

Destroy complete! Resources: 3 destroyed.

C:\Users\aksha\terraform-iam-users>
```

- Confirm the destruction by typing yes.

6. Conclusion:

This lab exercise demonstrates how to create multiple IAM users in AWS using Terraform. The use of variables and loops allows you to easily manage and scale the creation of IAM users. Experiment with different user names and settings in the main.tf file to understand how Terraform provisions resources based on your configuration.
